Brainstorm & Idea Prioritization

Project: Global Olympic Sports Performance Analysis

Ideas generated

- Country medal ranking with year and sport filters.
- Medal trends by Olympic year.
- Medal counts by sport category.
- Gold, silver and bronze medal composition.
- Athlete participation by country or sport.
- Summer versus Winter comparison if both seasons are present.
- Investment versus medal outcome scatter plot when investment data is available.
- Regional efficiency comparison when a validated region mapping and efficiency definition are available.
- Interactive website with data upload, KPI cards, chart filters and methodology notes.

Prioritization approach

Prioritize ideas by usefulness to the project scenarios, data availability, clarity of interpretation, and implementation effort. Build reliable medal and trend views first; add investment and regional comparisons only after validating the required fields.

Priority 1 — Core

- Top countries by medals.
- Medal trends by year.
- Medals by sport.
- Medal-type composition.
- Filters for year, country and sport.

Priority 2 — Conditional

- Investment versus medal outcomes, if the investment dataset contains compatible country/year measures.
- Regional efficiency, if region mapping and denominator definitions are validated.
- Summer versus Winter, if season is present and consistently defined.

Risks and mitigations

- Different datasets may have different levels of detail; validate keys before joining.
- Medal-result rows are not necessarily the same as unique athletes or unique medals.
- A ratio can be misleading if its denominator is zero, missing, or measured at a different grain.
- Association between investment and medals does not establish causation.
