Define Problem Statements

Project: Global Olympic Sports Performance Analysis

Primary problem statement

How can historical Olympic performance and athlete participation data be transformed into an accessible analytical view that helps stakeholders compare countries and sports, identify trends, and investigate whether sports investment is associated with medal outcomes?

Who experiences the problem?

- National Olympic Committee performance strategists deciding which sport categories merit further investment analysis.
- Funding analysts comparing investment inputs with performance outcomes.
- Journalists and data storytellers communicating Olympic trends to a general audience.

Why does it matter?

Without consistent definitions and clear comparisons, medal totals can be misinterpreted, investment may be compared with incompatible measures, and trends can be difficult to explain. A dashboard makes comparisons easier while documenting assumptions.

How might we questions

- How might we compare countries fairly when athlete participation and event opportunities differ?
- How might we identify sports with strong medal outcomes without treating past performance as a guarantee of future success?
- How might we compare investment and medal outcomes while avoiding unsupported causal claims?
- How might we explain trends over time in a clear, accessible story?

Success criteria

- Charts use validated fields and clearly named metrics.
- Filters work consistently across relevant views.
- Missing values and duplicate records are handled transparently.
- Investment and efficiency metrics are shown only when their definitions and grain are compatible.
- The website, Tableau dashboard and project documentation agree on the same findings.
