Project Overview

Project: Global Olympic Sports Performance Analysis

Project title

Global Olympic Sports Performance Analysis

Project purpose

This project explores Olympic performance patterns across countries, sports, years and athlete participation. It is intended to support evidence-informed discussion about medal outcomes, sport-category priorities, and the relationship between sports investment and performance.

Problem statement

Olympic performance data is spread across multiple datasets and can be difficult to compare consistently. Decision-makers need a clear, interactive way to examine medal results, participation, sport-level patterns and regional performance while understanding the limitations of the data.

Objectives

- Compare medal outcomes by country and sport.
- Explore medal trends over time and differences between Olympic seasons where the data supports it.
- Examine athlete participation and medal efficiency using clearly defined measures.
- Compare sports investment with medal outcomes only where compatible investment data is available.
- Communicate findings through a Tableau dashboard, Story and interactive project website.

Intended audience

National Olympic Committee strategists, sports funding analysts, journalists, and project reviewers.

Important data note

The exact dataset coverage, date range, record counts and KPI values must be confirmed from the source files before final submission. Do not state that the dataset covers 2026 unless the supplied files contain verified 2026 records.
